Purpose of Study
“Assessment of Symptoms and Side Effects in Pancreatic Adenocarcinoma Patients” is a research study currently being conducted at the Stanford Cancer Institute. Our research study aims to recognize prevalent symptoms and side effects associated with pancreatic adenocarcinoma and its treatments. Relatively little is known about the supportive care needs of pancreatic cancer patients and when those needs can be most effectively addressed. With results from this study, we can gain valuable information about pancreatic cancer patients and hope to improve future palliative care and quality of life.

Participants and their caregivers will be asked to do the following:

**Participant**
- Complete an initial questionnaire about your symptoms, lifestyle, and quality of life during one of your treatment visits to the Stanford Cancer Institute.
- Complete follow-up questionnaires (on paper or online) once a month for the next 11 months.

**Caregiver (Optional)**
- Complete an initial questionnaire about you and your illness and his or her experience as a caregiver.
- Complete follow-up questionnaires once a month for the next 11 months.

**Benefits of Participation**
Your participation will provide researchers with a better understanding about the nature of pancreatic cancer.
We hope that you will also learn a lot about yourself and your own symptoms throughout the course of the study.

Participation in a research study is an altruistic act that provides information that will improve care for future pancreatic cancer patients.
